

Credit Name: CSE 2140

Assignment Name: Mastery - Sleep and Digits3

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

Were there any parts of the problem you found confusing at first? If so, how did you resolve that

I didnt have any problems understanding the assignment, or anything i found confusing as it was pretty stright forward.

For the Sleep program, I knew how to write the code but needed to go about the math, so I went online and found some formula's that can help me put them in the code and get the answer that i was looking for. For Digits, it was pretty straight forward, where I just had to add another variable for the Hundreds place.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

How did you decide on the tools, data structures, or algorithms to use?

I broke the Code into 3 steps, the Display (System.out.print), the logic (Math) and variables(int ____;)

I didnt really need to decide any thing for the tools or data structures, as there wasnt much of it involved

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

How did you test your solution along the way to make sure it was working?

I attempted to write the code all at once, and it went succesfully.

I tested my code every time I had some math, to make sure it didnt give a false output

Overcoming Challenges

What part of the problem was the most difficult for you?

How did you handle moments when you felt stuck or unsure of what to do next?

The most difficult part to me was implementing the math into the code, and finding the right formulas.

I would research what I didnt know online, or in the Content section of d2l.

Learning

Was there anything you learned that you think will help you with future challenges? I learned to seperate each variable when printing text outputs with a "Text" + Variable "Text" +Varibale
